The women who received the PRP treatment were all between 46 and 48 years old. The researchers say they were able to collect eggs from most of these women, and fertilise them with their partners' sperm. Professor Adam Balen, chair of the British Fertility Society, warned that Platelet-rich plasma (PRP) treatment stimulates the ovaries, allowing for the creation and release of new eggs. In this case, any child conceived would carry genetic markers from both parents.

Recent developments in PRP (platelet enriched plasma) usage include its application in the ovarian rejuvenation process. This involves the use of PRP to stimulate the ovaries, allowing for the creation and release of new eggs. The process involves several stages:

- Receipt of eggs
- Storage of eggs in cold store
- Ovarian rejuvenation

This process is experimental and not widely accepted by the medical community. British experts have serious reservations about the treatment, as it involves the use of PRP in a manner not yet scientifically validated.

“I Donated My Eggs For The Money -- And I Don’t Regret It” — Huffington Post

Recently, I wrote about PRP (platelet enriched plasma) being used in an experimental treatment for ovarian rejuvenation. The process involves the use of PRP to stimulate the ovaries, allowing for the creation and release of new eggs. However, British experts have serious reservations about the treatment, as it involves the use of PRP in a manner not yet scientifically validated.
